

Apollo[®] SC

OVICIDE / MITICIDE

Do you want an economical, effective and flexible program to control mites?

APOLLO SC stops mites before they develop into a problem. The application window is from pre-bloom to midseason in fruit tree crops. Applied to over-wintering and summer eggs breaks the mite cycle. **APOLLO SC** also controls the nymph stage. Adult females that contact **APOLLO SC** lay infertile eggs.

Make one application per season. Apply with good coverage and good drying conditions for optimum benefit. The weather stick ability provides extended control.

Use **APOLLO SC** at the first sign of mite activity, when they are predominantly in the egg stage. Best results are achieved in the early season contact action before the mite eggs hatch.

You may not plan to use oil because of oil-sensitive varieties or young trees. **APOLLO SC** can be used in these situations to control over-wintering red mite eggs. If you used oil earlier and it is time to provide continued ovicidal activity, consider **APOLLO SC**. It prevents new outbreaks from occurring.

APOLLO SC controls European Red Mite, Two-Spotted Spider Mites and in BC also McDaniel Spider Mites. Red mites over winter as eggs on the tree while Two-Spotted and McDaniel mites over winter in the ground cover and migrate into crops later to lay their eggs.

Use **APOLLO SC** as your primary miticide in IPM programs. It is highly selective with no effect on beneficials including bees.

Use **APOLLOS SC** with **LI 700** pH adjuster/acidifier to maintain the proper pH of the spray water. The results will be more consistent with a spray pH of 7 or less. The ideal pH of 5.5 to 6.5 will protect the efficacy of **APOLLO SC**. **LI 700** is economical and maximizes the results of **APOLLO SC**.

APOLLO SC is compatible with most fungicides and insecticides. Consult the tank-mix partner labels for complete instructions.

APOLLO SC breaks the mite development cycle, providing good value to performance. It is easy to handle, one 473 mL bottle at the 300mL per hectare covers 4 acres.

Use **APOLLO SC + LI 700** and rest easy about your mite control. Check out the new lower cost of using Apollo.
