

Because NUANCE[®] contains tribenuron, it is an excellent and economical alternative to Express[®] SG herbicide!

**NUANCE[®]**
HERBICIDE

NUANCE[®] Herbicide, when applied in a tank-mix with glyphosate 24 hours prior to seeding, offers outstanding pre-seed burndown for spring wheat (including durum) winter wheat and barley. You can also use NUANCE for chem-fallow or for post-harvest applications.

HERE'S WHY: Tribenuron, the active ingredient in NUANCE is a proven performer that provides consistent, outstanding broadleaf weed control.

- **EFFECTIVE CONTROL**

NUANCE® herbicide offers outstanding control of tough broadleaf weeds like dandelion, flixweed and narrow-leaved hawk's beard in pre-seed burndown prior to seeding of spring wheat (including durum) winter wheat and barley. NUANCE can also be used for chem-fallow. The best control is obtained when NUANCE is applied to young, actively growing weeds.

- **FORMULATION**

NUANCE is available in a superb dry flowable dispersible granule formulation. The ease of mixing NUANCE offers is a real advantage for custom applicators.

- **MODE OF ACTION**

NUANCE is a sulfonylurea herbicide which means it is an ALS inhibitor. NUANCE is absorbed through the foliage of broadleaf weeds, rapidly inhibiting their growth.

- **TANK-MIX FLEXIBILITY**

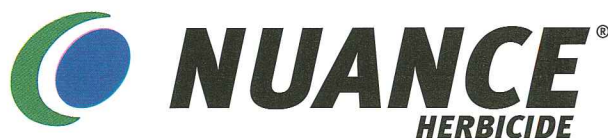

In addition to glyphosate, NUANCE may be mixed with other suitably registered herbicides such as 2, 4-D or MCPA ester for resistance management, expanded weed spectrum and size, and various use patterns.

- **PACKAGING**

NUANCE is packaged in 320 grams of product per bottle with each case containing eight bottles. At the most commonly used rate, each bottle of NUANCE will treat 80 acres.

- **RE-CROPPING FLEXIBILITY**

There are no restrictions on re-cropping choices the following season.
