

## SUPERIOR FORMULATION DELIVERS

### SEED TREATMENT

Rancona™ Apex is a seed applied fungicide that provides excellent protection against a broad spectrum of seed/seedling diseases on wheat, barley, rye, triticale and oats. Rancona Apex is a micro-dispersion formulation that makes it easy to apply and helps to ensure uniform coverage of seed which optimizes disease control.

Rancona Apex contains the broad spectrum fungicide ipconazole which is an exceptional systemic as well as contact fungicide that provides a superior disease protection package for seed and seedlings. The strengths of this dual action protection include control of smuts (including True Loose Smut), common bunt, Fusarium (seed and soil-borne), common root rot and leaf Stripe.

Western Canadian producers used Rancona Apex in the 2010 season and here are their views:

**Stephen Dewald – Wetaskiwin AB;** “Rancona was the most convenient seed treatment we have ever used as far as ease, accuracy, and consistency of application. No gumming up or plugging either, all those things that would have normally affected seeding efficiency and rate in the past, with other treatments we have used.”

**Ryan Mercer – Mercer Seeds Ltd, Lethbridge AB;** “ We found that during seed treatment applications below freezing temperatures Rancona was extremely stable and flowed very well, with even distribution on the seed for both wheat and barley. My air seeder operator commented that there was virtually no dusting off during filling, even if seed had been treated and stored for extended periods of time. I noticed longer lasting, stronger emergence efficacy, and vigorous seedlings, amazing given the cool, wet spring we had! As we continually push to seed earlier each spring, I believe in an effective multi-site product such as Rancona. It’s a must, given the pressures of an ever changing, and diverse disease spectrum, and our individual yield demands.”

**Doug Thul – D.R. Thul Farms Ltd., Drinkwater SK;** “ My dealer was very keen on having me try Rancona Apex, and from what I’ve seen so far it was a good suggestion. I use a drum mixer system. And I was not really happy with the way it worked with other fungicide seed treatments I have used. But with the Rancona Apex, right away I saw better flowability of product and better coverage on the seed.

I used Rancona Apex on my durum wheat seed. This is my first time using the product but if the initial treatment was any indication I’m expecting some good results. It seems we got much better coverage without having to add water compared to other seed treatments. The Rancona Apex came out of the jug easily, the jugs were easily rinsed and it went onto the seed very evenly.
